

A PROTOTYPE I DESIGNED AND BUILT

**What if you could
shop by mission,
not by item?**

THE PROBLEM

**We think “friends at 8”.
Apps make us search
twelve products.**

Party tonight

Weekly stock-up

Dinner for two

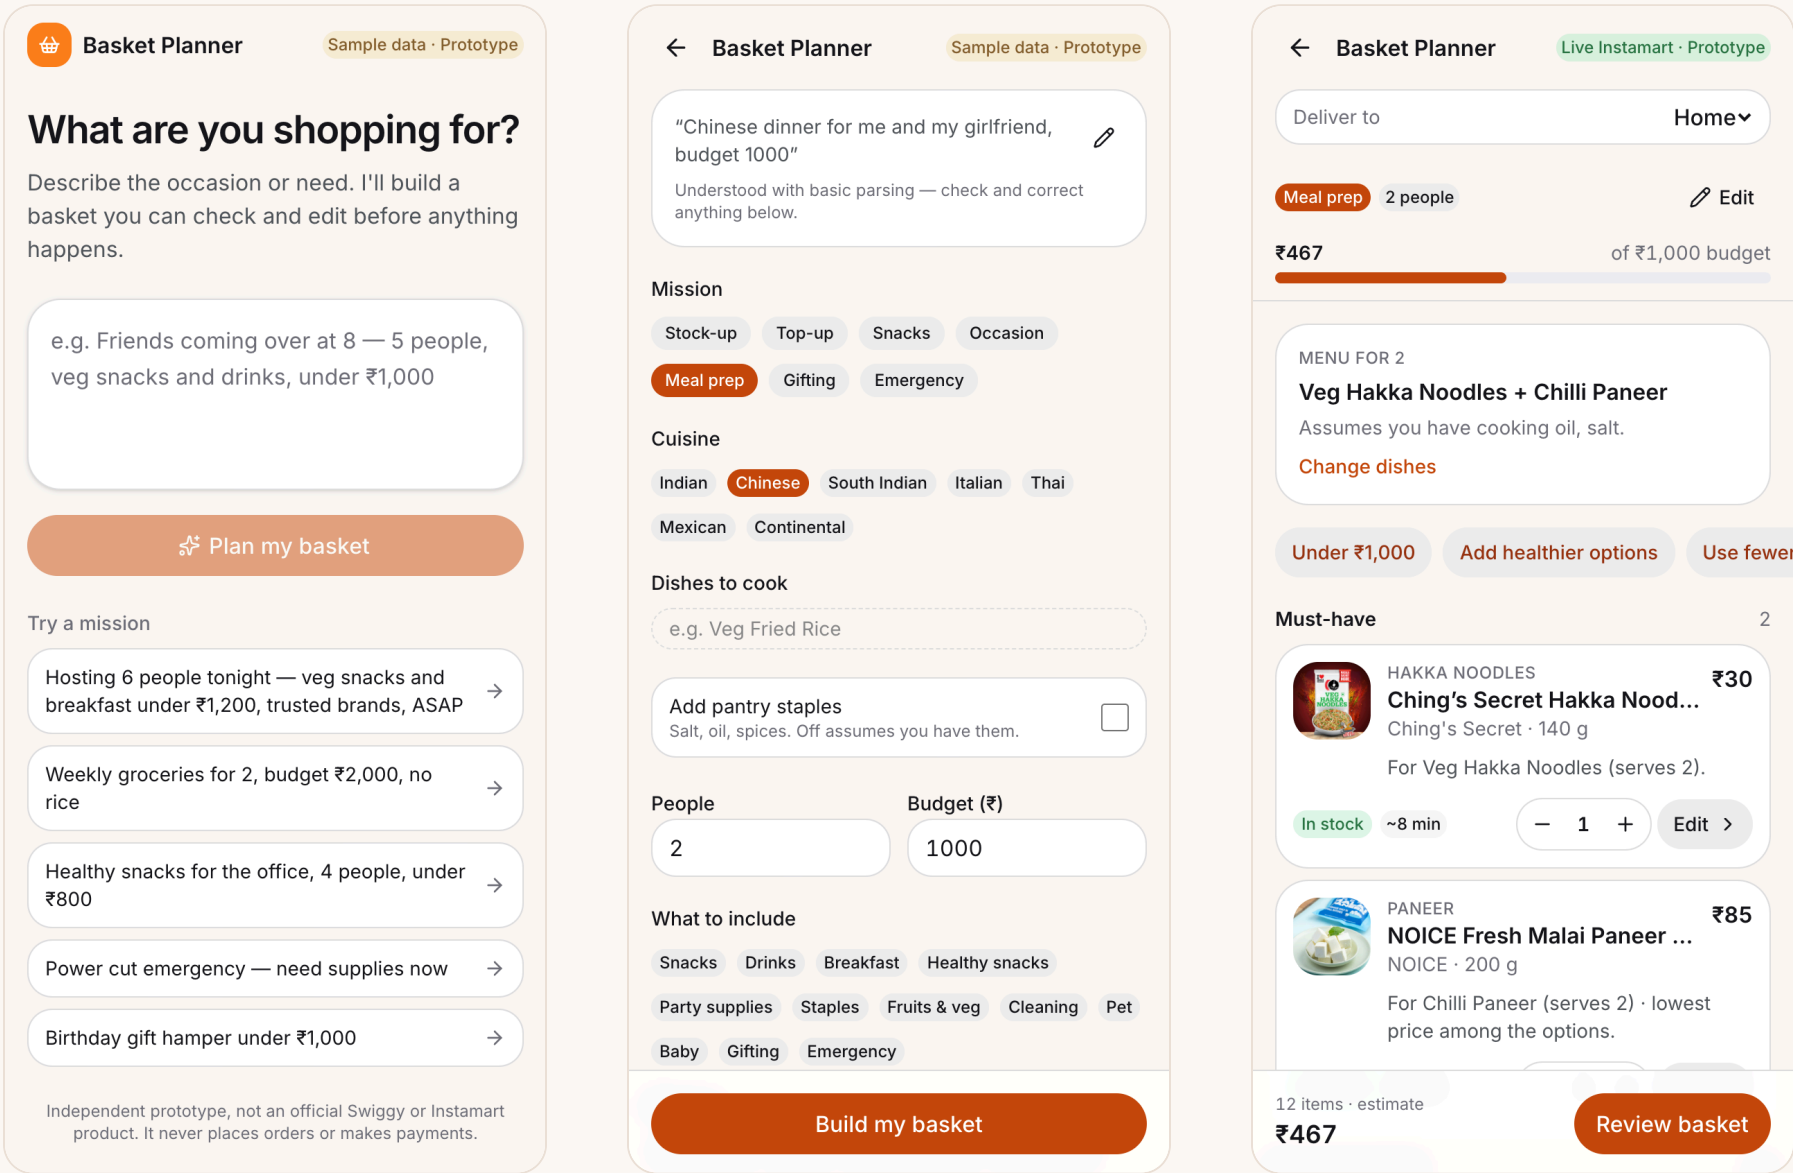

Power cut

Gift under ₹1,000

Quick commerce delivers in minutes. Planning the basket is still manual: search, compare, check stock, do the budget maths.

THE IDEA

One sentence in, an editable basket out

Say it your way

Check the details

Get the basket

AN EXAMPLE

“Chinese dinner for two, ₹1,000”

It planned Veg Hakka Noodles and Chilli Paneer,
then found 12 real Instamart products for ₹467.

Four steps behind one sentence

1

Understands the request

People, budget, diet and cuisine. AI only when it is vague.

2

Plans a menu

Picks dishes from a recipe base and scales the quantities.

3

Searches the catalogue

Live, through Swiggy's Instamart MCP.

4

Ranks and explains

In stock, within budget, a reason on every item.

WHAT I LEARNED

The first version suggested atta noodles for a Chinese dinner

It had no idea what a dish was. So I gave it recipes, and the baskets became accurate.

26

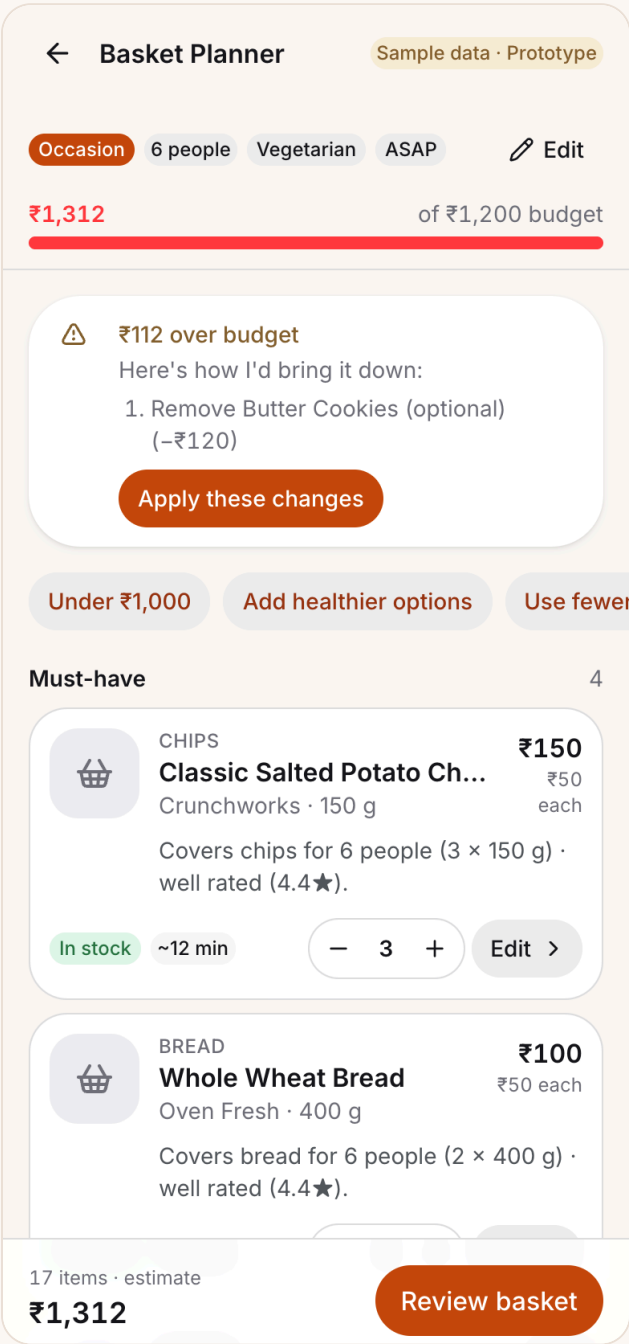

dishes I curated for Indian homes

241

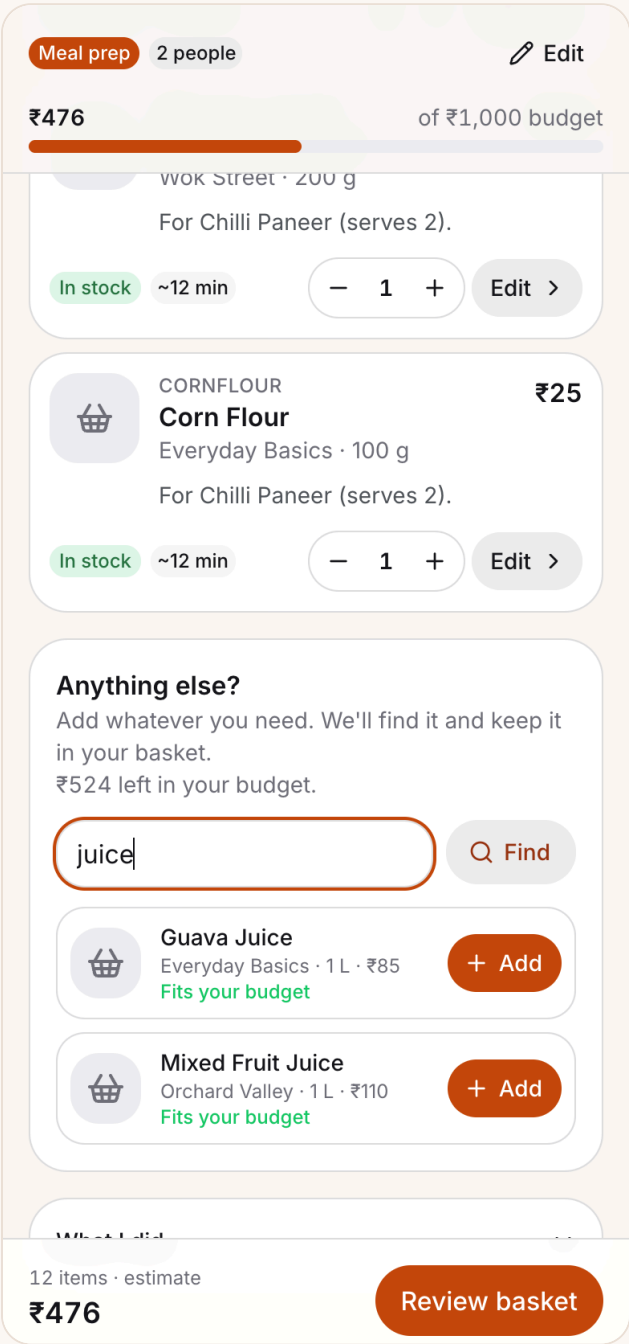

more from TheMealDB's free recipe API

TRUST AND CONTROL

It explains itself, and you stay in charge

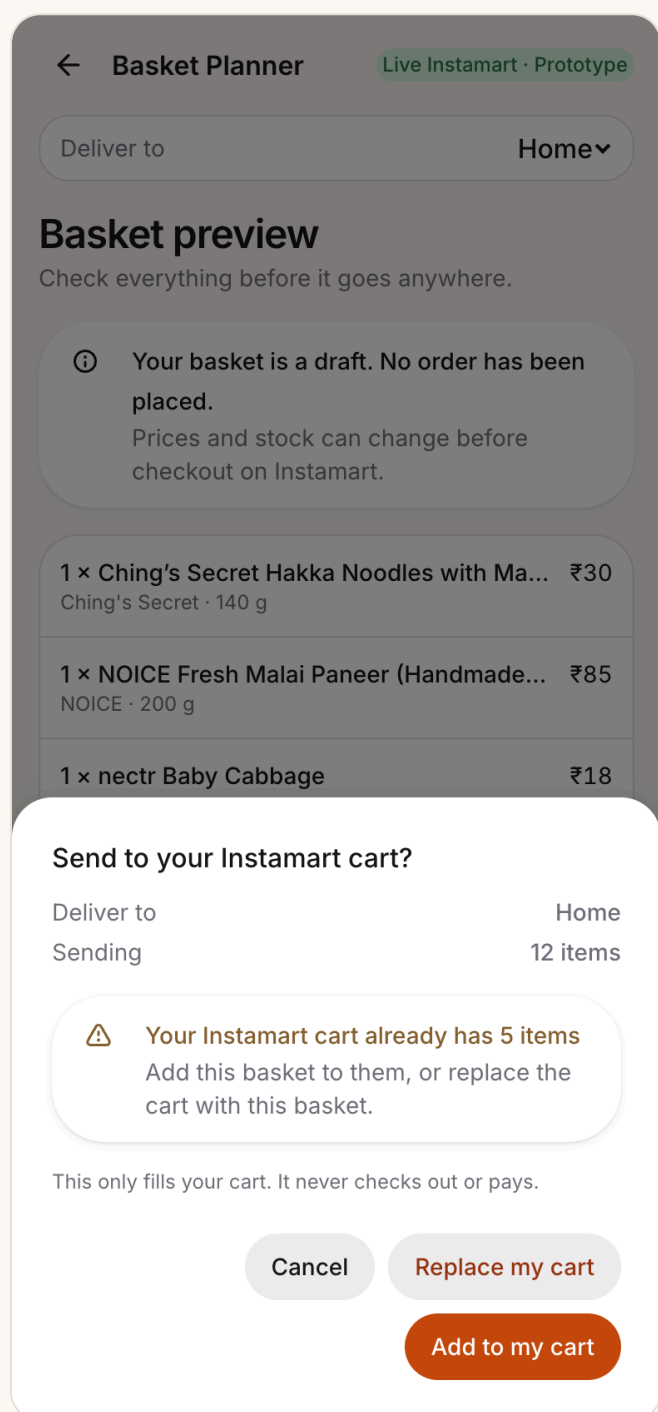

Over budget? It shows a plan

Add your own items

AT THE END

Review it, then send it to your Instamart cart

You confirm every send

It fills your real cart. You place the order in Swiggy.

Your cart is safe

Already have items? Add to them or replace them, your call.

Or keep it for later

Save the basket to reuse, or copy the list as text.

TRY IT

**Open it on your
phone and tell me
what you'd change**
